

Tree Care Tips from Trees Atlanta

Here some tips for taking care of your new tree(s). If you have questions or need assistance, please give us a call or visit our website for videos, tutorials, and tree care resources.

Thank you for helping us expand Atlanta's urban canopy!

Watering

As a general rule, apply 10 gallons of water every other week all at once during your new tree's first growing season (April-October). This encourages roots to expect infrequent but deep waterings. Continue to water evergreen trees throughout the winter. Watering should be focused where the roots are, which for one- to two-year-old trees is right around the base.

What does 10 gallons of water look like? Ten gallons of water is about a minute's worth of water from a garden hose, or two full Home Depot buckets.

How do I know if my tree needs more or less water? Depending on soil and rain conditions, trees may need more or less water. The soil should not stay saturated, but have time to dry out between waterings. If the soil is still moist, no need to water. If the soil feels dry, water your tree.

Mulching

Applying a thin, two- to four-inch layer of organic mulch improves the soil structure and oxygen levels, regulates temperature and moisture availability, and prevents weeds. **Please do not pile mulch up around the base of your tree's trunk!** Piled mulch can lead to insect problems and rot. Create a mulch ring that starts a hand's width (five to six inches) away from the base of the tree.

What kind of mulch should I use? We use untreated woodchips. Dyed or treated mulch can leach harmful chemicals into the soil.

Staking

A tree may need staking when it's young. Place a stake outside the planting hole area and tie the tree to the stake so that the tree is straight. Tie the tree with just enough tension to keep it from leaning, but not so much that the tree can't move around in the wind. The tree needs to be able to move to establish an adequate root system. Never use a material harder than the tree's wood to tie it up. We recommend ArborTie or soft woven strapping. Avoid wire, chains, fishing line, rope, or string. Leave stakes for one growing season.

What about the bamboo stick tied to my tree? Remove the bamboo in the fall after your tree's first summer.

Pruning

Trees are best pruned when they're young, and proper pruning is essential for excellent structure and tree health. Improper pruning can irreparably harm a tree.
